based on lax algebraic and categorical methods monoidal topology provides a unified theory for metric and topological structures with far reaching applications

this book provides the theory for stratified spaces along with important examples and applications that is analogous to the

surgery theory for manifolds in the first expository account of this field weinberger provides topologists with a new way of looking at the classification theory of singular spaces with his original results divided into three parts the book begins with an overview of modern high dimensional manifold theory rather than including complete proofs of all theorems weinberger demonstrates key constructions gives convenient formulations and shows the usefulness of the technology part ii offers the parallel theory for stratified spaces here the topological category is most completely developed using the methods of controlled topology many examples illustrating the topological invariance and noninvariance of obstructions and characteristic classes are provided applications for embeddings and immersions of manifolds for the geometry of group actions for algebraic varieties and for rigidity theorems are found in part iii this volume will be of interest to topologists as well as mathematicians in other fields such as differential geometry operator theory and algebraic geometry

accompanying cd rom contains fast facts checklists data sets to support exercises and color figures from the book

general topology offers a valuable tool to students of mathematics particularly in such courses as complex real and functional analysis this introductory treatment is essentially self contained and features explanations and proofs that relate to every practical aspect of point set topology hundreds of exercises appear throughout the text 1977 edition

this text is an introduction to topology and homotopy topics are integrated into a coherent whole and developed slowly so students will not be overwhelmed

the geodatabase workbook contains exercises to help you learn to create and edit geodatabases the first part of the workbook provides a hands on introduction to advanced geodatabase topics such as relationship classes subtypes default values domains topology geometric networks feature linked annotation and dimension features in the context of editing a sample geodatabase the second part provides exercises in using the feature editing tools in arcmap the last part of the workbook provides exercises for creating a geodatabase loading data and implementing advanced geodatabase behavior the quick start tutorial and the section on creating geodatabases require arcinfo or arceditor the section on editing focuses on editing simple features and many of the exercises can be done with arcview
